

Instructions for Future Reference and Use

Info for API Token

- This Token is used for making all future POST requests to the new API, used as a signature for the creation of new badges and assertions to users.
- This token creation is a very special case, normally the plugin handles this by itself.
- Created manually via the Postman program (explained later) and stored on the file in the path: “uploads/open-badges-framework/json/issuer_token_info.json” only on the very first time when activating this plugin.
- Every time a new request is made to publish a new badge the plugin goes through a process to check if this token has expired and if indeed expired then it does a special request to refresh this token and update the files contents.

Postman instructions for creating Token:

- Download and install the Postman program from here: <https://www.postman.com/>
- Create a new POST request exactly as the example below:

`https://api.eu.badgr.io/o/token?username=EMAIL&password=PASSWORD`
where EMAIL = email of the issuer account for BadgrEU (or appropriate server) and
PASSWORD = password of the issuer account.

- The results of the request must replace the contents of the file in “uploads/open-badges-framework/json/issuer_token_info.json” or create and put contents if file doesn't exist.

General Info for Usage:

- After testing, creating pseudo badges, follow this issue for specific instructions : <https://github.com/my-language-skills/open-badges-framework/issues/301>
- Need to remove all unnecessary badges and assertions ids from the stored file in order to allow future creation of these badges to the specific user.
- Revoke all badges to all recipients (this must be done for all badges issues separately) then delete the badge and delete the issuer profile.
- The above instructions assume that all badges were created for the purpose of testing and are not official badges.
